Goodenough and Heuser, Vol. 95, No. 3, December 1982

Page 809, Figs. 26 and 27 should have appeared as follows:

FIGURES 26 and 27 Fig. 26. Intact *Tetrahymena* cilium, unfixed, frozen while still attached to the cell. The exposed true surface of the cilialy membrane has a bumpy texture; the E fracture face beneath it carries scattered intramembranous particles. Exposed internally are two rows of relaxed outer dynein arms. The inset shows the upper row at higher magnification to allow direct comparison with Fig. 25. $\times 190,000$. Inset, $\times 480,000$. Fig. 27. Intact *Tetrahymena* cilium, unfixed, frozen while still attached to the cell. Membrane E fracture face is interrupted to reveal two rows of outer dynein arms. Relaxed configuration is particularly evident in the upper right-hand row. $\times 190,000$.
