

Due to a printer's error, the wrong Figure 1 appeared in the article by Kariv et al., "Altered major histocompatibility complex restriction in the NK1.1⁺ Ly-6C^{hi} autoreactive CD4⁺ T cell subset from class II-deficient mice" (December 1994, Vol. 180:2419-2424). The correct figure and its legend appear below. Please remove this page and insert it in your December 1994 issue of *The Journal of Experimental Medicine*.

Figure 1. Thy0 subset generation in class II-deficient mice. Thymocytes of 3 mo class II⁺ (wild-type) and class II⁻ littermates were analyzed for the presence of Thy0 by four-color immunofluorescence staining. Lower panels show the HSA and 3G11 profiles of the CD4⁺CD8^{low/-} cells gated as shown by the boxed region of the upper panels. The HSA⁻ cell fraction is further divided into Fr.I' and Thy0 based on 3G11 expression (marked, left) (1). CD4⁺CD8^{low/-} cells and Thy0 cells are 8.0 and 0.4% in wild-type and 1.4 and 0.3% in class II⁻ mice (percentages of total thymocytes). Absolute numbers of thymocytes recovered were similar (1.5×10^8 cells/mouse). Analysis of four mice each yielded similar results.
